

Augment Ventures February 2018 Newsletter

Last month we shared some big news about our new fund, our new website, and our three new investments. This month, we are highlighting two portfolio companies from our first fund - RayVio, and Mercatus.

RayVio makes Ultra Violet LED Light Engines for digital disinfection for air, water, and surfaces.

Mercatus is a Software-as-a-Solution Platform for Investment Lifecycle Management (ILM) to maximize returns on energy assets.

RayVio Introduces Quartz Self-Disinfecting Water Bottle

RayVio UV LED is the disinfecting engine in the Quartz Water Bottle, which was debuted at the CES Show in Las Vegas a few weeks ago. Check out the details below, and on the [Quartz Website](#).

RayVio UV LED can be used in hospital air handling systems to disinfect the air, to cure industrial glues and in printers to cure ink, disinfect food and beverage process, and point-of-use water systems such as drinking fountains, home faucets, and water bottles.

[RayVio](#) previously released the [Ellie](#) 60-second baby bottle disinfection system, which led to an engagement with a global leader in branded baby products. We are excited to see the Quartz Water Bottle coming to market now as well.

Mercatus ILM Digitally Transforms Investments and Operations

Mercatus ILM digitally transforms how energy asset investors deploy capital and operate in order to accelerate the return on project investment and asset operations portfolio.

They do this by empowering business function leaders with collaborative cloud technology that integrates the information and processes needed to optimally manage the complete energy investment lifecycle from origination through asset operation.

Check out the Mercatus solution on their [website](#), and check their [resources](#) page for in-depth thought leadership on energy investing.
